Macromedia DreamWeaver Ultradev

Macromedia Dreamweaver is an application used primarily by web designers. Using Dreamweaver, the designer creates templates that form the basic webpage outlook. Graphics, shockware, and flash are easily imported (although not generated by Dreamweaver), along with data connections. ASP, JS, and Coldfusion are spoken here.

The UltraDev version is quite a few years old at this point (released in 1999), however it is quite functional.

It is possible that this recipe may easily be adapted to the newer versions of Dreamweaver.

It has not been possible to sequence Dreamweaver without a runtime issue since before the second beta release of SoftGrid 2.0. Upon launch there is an error message that appears regarding a line in a startup HTML file. You can click OK and continue to work. We are not expert enough in this application to know if there is an issue of functionality here. The application appears to be OK otherwise.

NOTE: This recipe provides information on methods of installing software in a way that is compatible with the SoftGrid Platform. No warrantee is provided as to the use of this information, nor the appropriateness of the application to perform as advertised.

As always, it is the responsibility of administrators to ensure that the license agreements imposed by application ISVs are complied with.
