

# Analysis of App-V 5.0 SP1 Client & File System Filter Drivers

## ViewReparse Program

Performed on a Win 7 SP1 32-bit OS using the ViewReparse program with known source code.

Monitoring of Application executable Startup, creation of the Virtualization Environment, and Application Execution on testing if a file has a visible reparse.

Note that outside the VE we can see the reparse point, but inside the VE the drivers implement the reparse and hide existence of it from the application.

Monitoring performed using modified ProcMon drivers at different altitudes.
